WELCOME BACK TO OUR OFFICE!

iWellness Retina Scan

- NEW technology - A quick, non-invasive scan of your eye similar to an MRI or ultrasound.
- The scan shows the health of the **deeper layers of the retina**, which cannot be seen with regular equipment, allowing us to monitor for changes over time, and for earlier detection of problems that may affect your vision.
- This test can usually be done without the use of dilating drops.
- There is an additional fee of \$35 for the iWellness Retina Scan.

WE HIGHLY RECOMMEND ALL OF OUR PATIENTS CONSENT TO THIS PROCEDURE

INFORMATION REGARDING DILATING EYE DROPS

Dilating drops are used to enlarge the pupils of the eye to allow the doctor to obtain a better view inside of your eyes. Temporary light sensitivity and loss of the ability to focus up close are common side effects of dilation and usually subside within 3 to 6 hours after instillation of the drops. Distance vision is usually not affected. However, if you have any concerns about driving immediately following this procedure, arrangements can be made to reschedule for a more convenient time.

Risks without test: Possibility of not detecting eye disease that could lead to blindness (i.e. glaucoma, retinal tears or disease, etc.) There is no additional fee for dilation. I hereby authorize the doctor and/or assistants to administer dilating eye drops.
